

The *ESP* of *ESP*ionage

It is suspected that sections of the US military and security agencies have been using synthetic telepathy against 'internal subversives' for at least a decade.

If these networks continue to operate unchecked, soon our thoughts may no longer be our own!

DEMONS AT DIMENSIONAL DOORWAYS

We are surrounded by a sea of biophysical fields, and the so-called collective unconscious is merely a merging of the biophysical fields of humans and other life-forms. But within this biophysical biosphere may exist remnants of deceased individuals' biophysical fields, which channellers are able to access in contacting the departed or spirit guides. It may also be that, within this biosphere, the biophysical fields of different species merge to form group minds; for example, of the tiger or the wolf. Shamans and witch doctors throughout history have reported these phenomena, but the scientific knowledge to comprehend what might be going on has been absent until today.

Within this framework, it is possible that aliens from other dimensions are able to gain access to our biophysical biosphere by tapping into the energy given off in human sacrifices, black magic rituals and suchlike, thus allowing malevolent aliens—the so-called demonic entities—into our realm. A study of this phenomenon indicates it could be one of the principal paranormal causes of world wars.

It may be no coincidence that, in their systematic studies of paranormal phenomena, some Theosophists and initiates of the Order of the Golden Dawn could have tampered unknowingly with forces that opened gateways to other dimensions, thus enabling malevolent biophysical fields to enter our milieu. Once here, these malevolent demonic entities could easily have entered the minds of the European leaders, provoking them into starting the First World War that would slay so many young men, and releasing so much life-force and negative emotion upon which they could feed.

Secret US research into electronic gateways to other dimensions may also be enabling entities to enter our continuum with a view to poisoning the consciousness of humanity in preparation for war.

PARANORMAL RESEARCH TECHNIQUES

Throughout my research I have become aware of how useful remote viewing (RV) can be in gaining information on topics that have proved impossible to analyse by any other method. [An introduction to the science underlying RV and remote mind-control technology (RMCT) is published in NEXUS, vol. 3, no. 6.]

Having developed basic do-it-yourself guides for beginners in the RV field, I found that there was still an accuracy problem with these simple methods. So I set up the company, Paranormal Management Systems, to concentrate on the scientific study of RV and the development of techniques that would far outstrip most military methodologies in the West. Unfortunately, most RV practitioners have not had access to these new techniques and are utilising controlled remote-viewing methodologies as espoused by the Americans.

Any group of researchers willing to use the paranormal as an aid to investigation can make use of techniques such as remote viewing, telepathy and group-augmentation effects. So what are the steps involved?

Instead of switching off the brain stress system to inculcate the theta state of consciousness (the method I use in PMS training²⁶), a much simpler technique can be used—involving listening to baroque music to relax the brain for RV or telepathic operation. This baroque music technique was developed by the Bulgarians in their Suggestology Super Learning parapsychology training courses.²⁷ They found that the ordered, rhythmic nature of this music entrains alpha waves in the listener. It is much less efficient than the PMS training, but for beginners it is relatively easy just to listen to baroque music as a prelude to practising RV or telepathy.

GROUP-AUGMENTED RV & ESP CAPABILITIES

Researchers using RV to investigate UFOs, for instance, need to work together in groups for best results.

Firstly, the group decides on one particular target, be it an alien planet, military site, etc., and each member then tries to obtain RV data on the target. This is done separately so that none of the remote viewers gets a chance to discuss findings while in the process of remote viewing.

Once they have completed their RV, they look at all the data the group has acquired. The common characteristics of what they viewed remotely would be the details they should then concentrate on, because if all or most of the remote viewers saw the same thing independently, this would indicate that their RV was accurate.

A similar method can be used by ESP/telepathy research groups, whether they be involved in psychic questing or tapping into hidden knowledge in the collective unconscious.²⁸

So, by applying this method of statistical analysis to the group's data, accurate RV or ESP/telepathy episodes can be targeted, and meaningful results can be obtained even if any one individual's RV or ESP/telepathy capability is inaccurate. Consequently, the success that each individual achieves within the group will provide positive feedback and improve individual RV capability by a mechanism analogous to the 'hundredth monkey' effect—the learning of new habits at a distance with no physical contact. More on this shortly.

But let us return briefly to the work of Dr Jessica Utts of Stanford University. Through her statistical analysis of the results of US military RV tests she found that the RV effect was slightly greater than chance, thus proving that RV is indeed a real phenomenon.²⁹

European remote viewers are likely to be practising similar RV methods to the Americans, so they need to use a technique to filter out noise from the RV signal. By remote viewing a target firstly in an independent manner within a group and then going over the results as a group, much of the RV noise can be filtered out. This amplifies RV accuracy by augmenting the signal-to-noise ratio. So, using multiple remote-viewers to give a large database, non-correlated RV noise can be cancelled out by cross-correlating results—thus ignoring spurious data not noted by other members of the group and, instead, concentrating on details that everyone viewed remotely. This means that meaningful results can be gleaned by using group-augmented RV, even though the RV effect may only be slightly greater than chance.

As a caveat, PMS training methods (as well as the drastic techniques used by the Russians) can dramatically improve RV or ESP/telepathic efficiency. In my research I have found that groups of people who remotely view the same site at the same time actually amplify their RV capabilities and boost their RV efficiency. This is due to a merging of the biophysical RV-state functions of the fields involved.

I have mentioned the 'hundredth monkey' effect, where the more people practise a 'meme' (habitual action or activity), the easier that action becomes for the group. It is a well-known phe-

nomenon that when people or animals repeat the same meme, there is a threshold after which that meme becomes habitual to the race or species. The best example is the Japanese monkey that learnt to remove sand from its wild rice by washing handfuls of this sandy rice in the sea. Other members of its troop copied this meme. Once a hundred or so of its peers had learnt this action, the meme miraculously appeared in other monkey troops on other islands far removed from the original progenitor of this meme. The hundredth monkey phenomenon is a well-known anecdote about the spreading of memes by remote influencing.

My discussion of biophysical fields and how they can interact with the fields of other members of the species would seem to indicate that when a threshold number of biophysical fields learn a new meme, the intent for that meme is spread by spontaneous telepathy. This means that remote viewing is difficult at first, but it becomes easier as more people practise it.

A similar effect is demonstrated with ESP and telepathy.

Group-augmented ESP and telepathy can dramatically boost latent psi-talent in the individual and result in a growth of paranormal abilities as the biophysical field of the individual merges with the group and is amplified in the process. This amplification process of the individual's biophysical field is then carried over to the individual upon the return of the biophysical field to the single state.

Group amplification of biophysical fields enables the individual biophysical field to develop from morphogenetic functioning, through to primary consciousness, and hence to high-order consciousness where ESP/telepathic functions are accessible.

When the person's biophysical field leaves the group mind, it loses its high-order consciousness, but there is an augmentation of its natural consciousness. Continued practice of group-augmented ESP and telepathy leads to an acceleration of this development, as it is enhanced by the group mind.

In this way, individuals can achieve the maximum capabilities of their psi genes in the order of months rather than years. Furthermore, the genome can be

changed by biophysical field effects, so the group-augmented biophysical field can be used to change the group's genome to develop new psi-genes. It can also be used to enhance paranormal psycho-neuro-immunological effects in the individual, and thus can aid group members in achieving healthier, longer lives.³⁰

Indeed, any group of people can use RV or ESP/telepathy as a tool in their own research effort, or to cause physiological changes beneficial to health and longevity.

This is the first time these points have been mentioned outside of superpower military research facilities and the multinational research being undertaken by Sony.

US MILITARY INTEREST IN SYNTHETIC TELEPATHY

An article in *New Scientist* has described how Japanese scientists are beginning to read P300 brainwaves electronically, with a view to developing computers to scan the brain for verbal content.³¹ At present, this research has been able to match up only

Indeed, any group of people can use RV or ESP/telepathy as a tool in their own research effort, or to cause physiological changes beneficial to health and longevity.

a handful of words that pass through the subject's brain.

There has been much anecdotal reference to a super-secret group in the US military which has developed the means of electronically scanning the brain to read the subvocalisation that passes through a target's mind. Synthetic telepathy, or electronic brain-scanning, would be a valuable tool for the US military. However, since the fall of the Soviet Union, it fears its own population more than foreign enemies.

Lacking sophisticated telepaths developed by the Russians with a gamut of drugs, brain surgery, invasive electronic stimulation, amplification and psychotronic generator interfaces, the US military is rumoured to have perfected synthetic telepathy.

The electromagnetic signals in the brain are of a very weak intensity, but, in synthetic telepathy, only the signals associated with subvocalised thought are of interest. The areas of the brain associated with speech are the Broca, Wernicke and supplementary motor areas. So, by connecting these parts of the brain to a computer via electrodes, highly sophisticated computer systems can decode an information stream and read subvocalised thoughts in the brain.

It is well known that the National Security Agency (NSA), the largest of the US state security organisations, possesses the most advanced computer systems in the world. If Japanese medical research is already detecting a few key-words just using P300 EEG signals, then it is very likely that the NSA can read substantial portions of subvocalised thoughts. If the alleged transfer of alien technology from the so-called "Greys" is factored in, then full comprehension abilities may already have been achieved.

In the article titled "Covert Operations of the US National Security Agency" [NEXUS, vol. 3, no. 3], the author, John St Clair Akwei, makes mention of EMF Brain Stimulation for Remote Neural Monitoring (RNM) and Electronic Brain Link (EBL) technologies. Such electronic RMCT has been in development since the *MKULTRA* program of the early 1950s, and, in fact, the US military has been using RNM since the early 1980s.

It is alleged that the Kinnecome Group at the NSA's Fort Meade is deploying this RMCT against US citizens on a grand scale. Another group at Fort Bragg is alleged to be using synthetic telepathy and electronic RMCT to augment the capabilities of Green Berets involved in their program. One of the aims of the research may be to remove conscience in the soldiers so that they may be better equipped for expunging internal 'subversives' such as militia group members.

REMOTE MIND-CONTROL TECHNOLOGIES

My research into biophysical RMCT has enabled me to discover the principles by which this electronic RMCT could be made to work. It also appears that so-called 'alien technology' has not been needed in the development of synthetic telepathy.

For synthetic telepathy to be effective against a targeted 'subversive', it has to be usable without 'controllers' physically having to place electrodes on the target's head or implants in the brain. So, US military personnel may first have developed the use of masers, and other radio-fre-

quency (RF)/microwave devices that carry ELF audiograms, to interfere with the brain's motor areas at a distance. They might have achieved this by destructively interfering with the motor neurone signals (rather like the systems used to generate real-time replicas of the noise made by a car engine, but out of phase, so cancelling the roar of the motor by destructive audio interference), or by just simply swamping the brain with the 10-Hz bioelectric resonance signal associated with motor impulse coordination, which could induce paralysis in the victim.

In the event of being detained, a subversive might then be subjected to a crude form of synthetic telepathy involving electrodes being placed on his/her head. Short-term-memory brain-wiping technology would then be applied, combined with ELF audiograms that inhibit calcium efflux in the brain, with the result that the prisoner is unable to remember what has happened to him. The next step would be to implant microelectronic devices in the prisoner's brain, in order for behavioural control and synthetic, telepathic, subvocalised control signals to be transmitted directly to the brain, bypassing the ears.³²

However, it must have become clear to the US military that some technique for effecting synthetic telepathy from a distance would be a more effective option.

The military may have found an opportunity to test and deploy its primitive

physical synthetic telepathy technology, using as a smokescreen a worldwide cover story about alien abductions (even if they are in fact really going on). In any case, these alien abduction rumours have an added advantage in that anyone abducted by the US military for interrogation or experimentation would never be believed!³³

Deployment of new technology incorporating low-frequency

Synthetic telepathy requires techniques for scanning the specific brain emissions given off when the targeted victim subvocalises.

microwaves and RF is at least a decade old. Security personnel can use it to scan through bodies and walls like X-rays,³⁴ and see and track a target victim at home. But once they can see inside that person's head, they can conduct computer-controlled targeting by firing pulsed-frequency masers at specific brain centres. ("Maser" is the acronym for "microwave amplification by the stimulated emission of radiation".) This type of targeting is feasible considering the sophisticated computers in the NSA's possession.

Synthetic telepathy requires techniques for scanning the specific brain emissions given off when the targeted victim subvocalises. The techniques must be able to detect the 15-Hz, 5-milliwatt auditory cortex brain emissions that are linked with sound that bypasses the ear; the ELF frequencies that are linked with the excitation potentials in the brain that are associated with subvocalised thought; and EEG signals, such as the P300 signals mentioned previously.

The main problem with scanning these brain emissions is that the environment around the target contains a vast background EM noise that swamps the brain's tiny 5-milliwatt signals. At a distance it is impossible to fix a detector on the 15-Hz-centred window of ELF signals or the P300 emission band unless the low-level signal can be extracted from the noise.

My interest in this subject arose from my research in augmenting weak RV signals. As described previously, by using group-augmented RV, weak information signals can be picked out from the much larger background noise because the noise affects each remote viewer in a different way. However, each remote viewer detects aspects of the same weak RV signal in the same way.

This method of using many detectors to read parallel signals of the same source can be used to pick out very weak signals of interest, buried in a sea of random noise, because the same weak signal is detected by all the receivers. Cross-referencing the multiple signal returns from all the receivers, and looking only for identical signals, allows a very weak signal to be detected from the background noise.

Dr Ross Adey, at Loma Linda Veterans Administrative Hospital in California, discovered that the best method for getting an ELF signal into a human brain is with pulse modulation of a high-frequency field.³⁵ By firing ELF pulse-modulated masers, which can scan up and down the window of frequency emissions given off by subvocalised thought, interference effects can be measured in the maser beam.

The targeted victim's ELF brain emissions may interact constructively or destructively with the pulsed-frequency maser carrying ELF in the ELF window associated with subvocalised thoughts. If out-of-phase converging pulsed masers are fired at a victim's brain or brain centre, the out-of-phase ELF modulations of the masers cancel each other out by destructive interference. Thus, no resonance effects in the brain are established to perturb the brain emissions of subvocalisation.³⁶ Since the converging ELF-modulated masers are affected by low-level emissions in the target's brain, shifts in the ELF-pulsed signal going into the brain can be detected.

A simplistic version of this would be to direct a laser beam at a window in the targeted person's home. The vibrations in the window cause modulations in the laser that can be converted into electrical signals and hence into sound.

In RMCT (pulsed ELF-audiogram-modulated interference-maser synthetic-telepathy), the ELF emissions in the target's brain may interfere constructively or destructively with the ELF modulations carried by the maser as it pulses up and down the frequency range window of subvocalised thought. But before this data can be analysed, the low-level signal has to be picked out of the noise.³⁷ Since at least two pairs of converging masers have to be targeted on the brain of the victim, his ELF emissions will affect the maser beams in exactly opposite ways, while the background noise will cause various changes in the two masers. If only identical but opposite perturbations are looked for in the pulsed window of ELF-modulated maser return signals, then, with computer simulation, a real-time picture can be produced of ELF emissions in the victim's brain.

Having already built up a library of excitation potential signatures for differing words and word groupings, a sophisticated computer can begin to decode the emission signatures into word streams. In this way, the victim's subvocalised thoughts can be stored in the memory of NSA state-of-the-art computers, ready for analysis by NSA personnel.

Using ELF audiograms carried by a single pulse-modulated maser, subvocalised thoughts can be placed in the victim's brain. This gives synthetic telepathy operators the ability to enter into conversations with a targeted 'subversive' to drive him mad, and to input key-words to get the victim thinking about the information they wish to find.

THE SPECTRE OF THOUGHT CONTROL

Telepathy has come a long way since the early days of research. Russian telepaths have made massive advances in the biophysical and electronic spheres of research, while the US military in all probability already has a fully-functioning synthetic telepathy system.

The head of US Special Forces, Major-General Schaknow, made the

first public revelations about synthetic telepathy during a July 1992 lecture at Fort Bragg, North Carolina. Certainly, the mechanisms by which synthetic telepathy might operate are well within the capabilities of US military technology. Without being limited by qualms or ethical concerns, the military is almost certain to have developed synthetic telepathy in a usable form³⁸ and deployed it against internal 'subversives' such as militia members and black activists.

It seems that your own thoughts may no longer be private. Worse still, your own thoughts might not be your own. George Orwell's *1984* might be Utopia compared to the police state of the mind which agents of the New World Order are building under our very noses.

The head of US Special Forces, Major-General Schaknow, made the first public revelations about synthetic telepathy during a July 1992 lecture at Fort Bragg, North Carolina.

About the Author:

Turan Rifat was born in Brighton in 1957. He has a university science degree and another in education. Whilst doing his Ph.D., the author decided he'd had enough of mechanistic science, so for the past 15 years he has been researching the paranormal. His research task took rather longer than imagined, and led to some unfortunate confrontations with 'evil' forces—MI5 being the least of these.

Recently, he set up Paranormal Management Systems (PMS), the only company in Europe with expertise in biophysical RMCT that can come close to what the Russians have developed and which outstrips the US knowledge base in the biophysical area. PMS evaluates this military-domain RMCT material and develops it in terms of its applications for business in enhancing profitability and performance.

Turan Rifat offers courses and consultancy in the RV/RI field. He is currently writing a book, *Remote Viewing: The Story of the Real X-Files*.
